

**CLAIM AMENDMENTS**

Claim 1 (previously presented):

A method for detecting accidental contact between a person and a dangerous portion of a woodworking machine, the method comprising:

providing a first electrode electrically coupled to the person;

providing a second electrode electrically coupled to the dangerous portion;

transmitting a signal by one of the first or second electrodes;

detecting whether the transmitted signal is received by the other of the first or second electrodes; and if so,

sampling the signal a plurality of times within 200 microseconds to determine if the signal has at least one predetermined characteristic indicative of contact between a person and the dangerous portion.

Claim 2 (withdrawn):

The method of claim 1, where the step of transmitting includes transmitting the signal by the first electrode through the person.

Claim 3 (withdrawn):

The method of claim 1, where the step of transmitting includes transmitting the signal by the second electrode through the dangerous portion.

**Claim 4 (withdrawn):**

The method of claim 1, where the woodworking machine includes at least one cutting tool, and where the step of providing a second electrode includes providing a second electrode electrically coupled to the at least one cutting tool.

**Claim 5 (withdrawn):**

The method of claim 1, where the woodworking machine includes at least one guard, and where the step of providing a second electrode includes providing a second electrode electrically coupled to the at least one guard.

**Claim 6 (withdrawn):**

The method of claim 1, where the step of transmitting includes transmitting an alternating electrical signal.

**Claim 7 (withdrawn):**

The method of claim 6, where the alternating electrical signal has a particular frequency, and where the step of identifying includes identifying contact if an electrical signal having the particular frequency is received.

**Claim 8 (withdrawn):**

The method of claim 1, where the step of transmitting includes transmitting a ground electrical signal.

**Claims 9-20 (cancelled).**

Claim 21 (withdrawn):

The method of claim 1, where the dangerous portion is a blade with cutting teeth, and where the sampling occurs while a single tooth is in contact with the person.

Claim 22 (withdrawn):

The method of claim 1, where the sampling occurs within 100 microseconds.

Claim 23 (withdrawn):

The method of claim 1, where the sampling occurs in less than 100 microseconds.

Claim 24 (amended):

The method of claim 1, where the ~~at least one~~ predetermined characteristic indicative of contact between a person and the dangerous portion distinguishes such contact from proximity between a person and the dangerous portion.

Claim 25 (amended):

The method of claim 24, where the ~~at least one~~ predetermined characteristic indicative of contact between a person and the dangerous portion involves peak-to-peak amplitude.

Claim 26 (amended):

The method of claim 24, where the ~~at least one~~ predetermined characteristic indicative of contact between a person and the dangerous portion involves phase.

**Claim 27 (amended):**

The method of claim 24, where the ~~at least one~~ predetermined characteristic indicative of contact between a person and the dangerous portion involves a positive value.

**Claim 28 (amended):**

The method of claim 24, where the ~~at least one~~ predetermined characteristic indicative of contact between a person and the dangerous portion involves a negative value.

**Claim 29 (previously presented):**

A method for detecting accidental contact between a person and a dangerous portion of a woodworking machine, the method comprising:

- providing a first electrode electrically coupled to the person;
- providing a second electrode electrically coupled to the dangerous portion;
- transmitting a signal by one of the first or second electrodes;
- receiving the transmitted signal by the other of the first or second electrodes; and
- performing a step of sampling the signal a plurality of times to determine if the signal has at least one predetermined characteristic indicative of contact between a person and the dangerous portion.
